STABILITY OF GORENSTEIN FLAT CATEGORIES
WITH RESPECT TO A SEMIDUALIZING MODULE

ZHENXING DI, ZHONGKUI LIU AND JIANLONG CHEN

ABSTRACT. We first introduce in the paper the $W_F$-Gorenstein modules to establish the following Foxby equivalence:

$$
\mathcal{G}(F) \cap \mathcal{A}_C \overset{C \otimes_R -}{\rightleftharpoons} \mathcal{G}(W_F) \overset{\text{Hom}_R(C, -)}{\leftarrow}
$$

where $\mathcal{G}(F)$, $\mathcal{A}_C$ and $\mathcal{G}(W_F)$ denote the class of Gorenstein flat modules, the Auslander class and the class of $W_F$-Gorenstein modules, respectively. Then, we investigate two-degree $W_F$-Gorenstein modules. An $R$-module $M$ is said to be two-degree $W_F$-Gorenstein if there exists an exact sequence $\mathbb{G}_* = \cdots \to G_1 \to G_0 \to G^0 \to G^1 \to \cdots$ in $\mathcal{G}(W_F)$ such that $M \cong \text{im}(G_0 \to G^0)$ and $\mathbb{G}_*$ is Hom$_R(\mathcal{G}(W_F), -)$ and $\mathcal{G}(W_F)^+ \otimes_R -$ exact. We show that two notions of the two-degree $W_F$-Gorenstein and the $W_F$-Gorenstein modules coincide when $R$ is a commutative $GF$-closed ring.

1. Introduction. Throughout this article, $R$ is a commutative ring with identity and all modules are unitary. We denote by $R$-Mod the category of $R$-modules. For an $R$-module $M$, the Pontryagin dual or character module Hom$_\mathbb{Z}(M, \mathbb{Q}/\mathbb{Z})$ is denoted by $M^+$. Recall from White [11] that an $R$-module $C$ is said to be semidualizing if $C$ admits a degreewise finite projective resolution, the natural homothety map $R \to \text{Hom}_R(C, C)$ is an isomorphism and Ext$^1_R(C, C) = 0$. Examples include the rank one free modules and a dualizing (canonical) module when one exists. With this notion, the Auslander class and the Bass class with respect to a fixed semidualizing $R$-module $C$, denoted by $\mathcal{A}_C$ and $\mathcal{B}_C$, respectively, can be defined.

2010 AMS Mathematics subject classification. Primary 16E05, 16E10, 55U15.

Keywords and phrases. Semidualizing module, $G_C$-flat module, $W_F$-Gorenstein module, Bass class, stability of category.

1839
and studied naturally. It is well known that there exists the following equivalence of categories:

\[
\mathcal{A}_C \xleftarrow{C \otimes_R -} \xrightarrow{\text{Hom}_R(C, -)} \mathcal{B}_C.
\]

Recently, as a generalization of the classes of Gorenstein projective and Gorenstein injective modules, denoted by \(\mathcal{G}(\mathcal{P})\) and \(\mathcal{G}(\mathcal{I})\), respectively, Geng and Ding [4] introduced the notions of the \(\mathcal{W}_P\)-Gorenstein and the \(\mathcal{W}_I\)-Gorenstein modules. In particular, they obtained the following interesting equivalences of categories:

\[
\mathcal{G}(\mathcal{P}) \cap \mathcal{A}_C \xleftarrow{C \otimes_R -} \xrightarrow{\text{Hom}_R(C, -)} \mathcal{G}(\mathcal{W}_P)
\]

and

\[
\mathcal{G}(\mathcal{W}_I) \xleftarrow{C \otimes_R -} \xrightarrow{\text{Hom}_R(C, -)} \mathcal{G}(\mathcal{I}) \cap \mathcal{B}_C;
\]

where \(\mathcal{G}(\mathcal{W}_P)\) and \(\mathcal{G}(\mathcal{W}_I)\) denote the classes of \(\mathcal{W}_P\)-Gorenstein and \(\mathcal{W}_I\)-Gorenstein modules, respectively. So it is natural to ask if there exist some other classes satisfying the following diagram:

\[
\mathcal{G}(\mathcal{F}) \cap \mathcal{A}_C \xleftarrow{C \otimes_R -} \xrightarrow{\text{Hom}_R(C, -)} ?
\]

The motivation of the present article is the “?.”

We shall introduce in Section 3 the notion of the \(\mathcal{W}_F\)-Gorenstein module, which plays the role of “?.” Combined with \(\mathcal{W}_P\)-Gorenstein and \(\mathcal{W}_I\)-Gorenstein modules, they can be treated from a similar aspect as the relationship among projective, injective and flat modules in classical homological algebra theory. An \(R\)-module \(M\) is said to be \(\mathcal{W}_F\)-Gorenstein if there exists an exact sequence

\[
\mathcal{W}_\bullet = \cdots \rightarrow W_1 \rightarrow W_0 \rightarrow W^0 \rightarrow W^1 \rightarrow \cdots
\]

in \(\mathcal{F}_C\) such that \(M \cong \text{im}(W_0 \rightarrow W^0)\) and \(\mathcal{W}_\bullet\) is \(\text{Hom}_R(\mathcal{P}_C, -)\) and \(\mathcal{I}_C \otimes_R -\) exact, where \(\mathcal{F}_C\), \(\mathcal{P}_C\) and \(\mathcal{I}_C\) denote the classes of \(C\)-flat, \(C\)-projective and \(C\)-injective modules, respectively. In particular, we get the following theorem demonstrating the relationship between the classes \(\mathcal{G}(\mathcal{W}_F)\) and \(\mathcal{G}\mathcal{F}_C\) (see Theorem 3.4):
Theorem I. Let $C$ be a semidualizing $R$-module. Then $\mathcal{G}(\mathcal{W}_F) = \mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C$. Also, the $\mathcal{G}(\mathcal{W}_F)$-projective dimension for any $R$-module will be discussed in this section.

In Section 4, we first introduce the modules that arise from an iteration of the above construction. To wit, let $\mathcal{G}^2(\mathcal{W}_F)$ denote the class of $R$-module $M$ for which there exists an exact sequence

$$\mathbb{G}_* = \cdots \rightarrow G_1 \rightarrow G_0 \rightarrow G^0 \rightarrow G^1 \rightarrow \cdots$$

in $\mathcal{G}(\mathcal{W}_F)$ such that $M \cong \text{im}(G_0 \rightarrow G^0)$ and $\mathbb{G}_*$ is $\text{Hom}_R(\mathcal{G}(\mathcal{W}_F), -)$ and $\mathcal{G}(\mathcal{W}_F)^+ \otimes_{R}$-exact. Similarly, one can also define $R$-modules which belong to $\mathcal{G}^2(\mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C)$ or $\mathcal{G}^2(\mathcal{F})$, although the definition above differs from that in [9], there is still a good correspondence. We then apply techniques obtained in the former section to get our results concerning stability properties of Gorenstein categories (see Theorem 4.5, Corollary 4.6 and Corollary 4.7).

Theorem II. Let $R$ be a $\mathcal{G}\mathcal{F}$-closed ring and $C$ a semidualizing $R$-module. Then the following hold:

(i) $\mathcal{G}^2(\mathcal{W}_F) = \mathcal{G}(\mathcal{W}_F)$.
(ii) $\mathcal{G}^2(\mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C) = \mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C$.
(iii) $\mathcal{G}^2(\mathcal{F}) = \mathcal{G}(\mathcal{F})$.

In the remainder of the paper, let $C$ be a fixed semidualizing $R$-module. We mainly recall some necessary notions and definitions in the next section.

2. Preliminaries. Let $\mathcal{X}$ and $\mathcal{Y}$ be two classes of $R$-modules. We begin with the following definition.

Definition 2.1. We write $\mathcal{X} \perp \mathcal{Y}$ (respectively, $\mathcal{X} \cap \mathcal{Y}$) in case $\text{Ext}^2_{R\mathcal{F}}(X, Y) = 0$ (respectively, $\text{Tor}^1_{R\mathcal{F}}(X, Y) = 0$) for each object $X \in \mathcal{X}$ and object $Y \in \mathcal{Y}$. For an $R$-module $M$, when $\mathcal{X} = \{M\}$, we use the notation $M \perp \mathcal{Y}$ instead of $\{M\} \perp \mathcal{Y}$. There are some analogues such as $M \cap \mathcal{Y}$, $\mathcal{X} \perp M$ and $\mathcal{X} \cap M$. Following [10], we say that $\mathcal{X}$ is a generator for $\mathcal{Y}$ if $\mathcal{X} \subseteq \mathcal{Y}$ and for each object $Y \in \mathcal{Y}$, there exists a short exact sequence

$$0 \rightarrow Y' \rightarrow X \rightarrow Y \rightarrow 0$$
in \( \mathcal{Y} \) such that \( X \in \mathcal{X} \). The class \( \mathcal{X} \) is a projective generator for \( \mathcal{Y} \) if \( \mathcal{X} \) is a generator for \( \mathcal{Y} \) and \( \mathcal{X} \perp \mathcal{Y} \).

**Definition 2.2.** For any \( R \)-module \( M \), we recall three types of resolutions.

(i) \([5, 1.5]\). A left \( \mathcal{X} \)-resolution of \( M \) is an exact sequence \( X = \cdots \rightarrow X_1 \rightarrow X_0 \rightarrow M \rightarrow 0 \) with \( X_n \in \mathcal{X} \) for all \( n \geq 0 \).

(ii) \([5, 1.5]\). A right \( \mathcal{X} \)-resolution of \( M \) is an exact sequence \( X = 0 \rightarrow M \rightarrow X_0 \rightarrow X_1 \rightarrow \cdots \) with \( X^n \in \mathcal{X} \) for all \( n \geq 0 \).

Now let \( X \) be any (left or right) \( \mathcal{X} \)-resolution of \( M \). We say that \( X \) is co-proper if the sequence \( \text{Hom}_R(\mathcal{X}, X) \) is exact for each object \( X \in \mathcal{X} \).

(iii) \([11, 1.6]\). A degreewise finite projective (respectively, free) resolution of \( M \) is a left projective (respectively, free) resolution \( \mathcal{P} \) of \( M \) such that each \( P_i \) is finitely generated projective (respectively, free). It is easy to verify that \( M \) admits a degreewise finite projective resolution if and only if \( M \) admits a degreewise finite free resolution.

**Definition 2.3.** The \( \mathcal{X} \)-projective dimension of an \( R \)-module \( M \) is defined as:

\[
\text{pd}_R(M)_{\mathcal{X}} = \inf \{ \sup \{ n \mid X_n \neq 0 \} \mid X \text{ is a left } \mathcal{X} \text{-resolution of } M \}.
\]

Dually, one can also define the \( \mathcal{X} \)-injective dimension of \( M \).

The next lemma has a standard proof.

**Lemma 2.4.** Let \( M \) be an \( R \)-module. Consider the following exact sequence in \( \mathcal{X} \):

\[
X = \cdots \rightarrow X_1 \xrightarrow{\delta_1^X} X_0 \xrightarrow{\delta_0^X} X_{-1} \rightarrow X_0 \rightarrow X_1 \rightarrow \cdots.
\]

Then the following hold:

(i) Assume \( M \perp \mathcal{X} \). If \( X \) is \( \text{Hom}_R(M, -) \) exact, then \( \text{Ext}_R^{\geq 1}(M, \text{im}(\delta_i^X)) = 0 \) for all \( i \). Conversely, if \( \text{Ext}_R^{\geq 1}(M, \text{im}(\delta_i^X)) = 0 \) for all \( i \), then \( X \) is \( \text{Hom}_R(M, -) \) exact.
(ii) Assume $M \nrightarrow X$. If $X$ is $M \otimes_R$-exact, then $\text{Tor}^R_{\geq 1}(M, \text{im}(\delta^X_i)) = 0$ for all $i$. Conversely, if $\text{Tor}^R_{1}(M, \text{im}(\delta^X_i)) = 0$ for all $i$, then $X$ is $M \otimes_R$-exact.

**Definition 2.5.** [3]. An $R$-module $M$ is said to be Gorenstein flat if there exists an exact sequence

$$X = \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow F^0 \rightarrow F^1 \rightarrow \cdots$$

in $R$-Mod with each $F_i$ and $F^i$ flat such that $M \cong \text{im}(F_0 \rightarrow F^0)$ and $X$ is $I \otimes_R$-exact for any injective $R$-module $I$. The exact sequence $X$ is called complete flat resolution of $M$.

In the following, we denote the class of Gorenstein flat modules by $\mathcal{G}(\mathcal{F})$.

**Definition 2.6.** [1]. Let $R$ be a ring. We call $R$ GF-closed if the class of Gorenstein flat $R$-modules is closed under extensions, that is, if $0 \rightarrow X \rightarrow Y \rightarrow Z \rightarrow 0$ is a short exact sequence with $X$ and $Z$ Gorenstein flat modules, then $Y$ is also Gorenstein flat.

It follows from [1] that the class of GF-closed rings includes strictly the one of coherent rings and the one of rings of finite weak global dimension.

**Definition 2.7.** [7]. An $R$-module is $C$-projective (respectively, $C$-flat) if it has the form $C \otimes_R P$ for some projective (respectively, flat) $R$-module $P$. An $R$-module is $C$-injective if it has the form $\text{Hom}_R(C, I)$ for some injective $R$-module $I$. We set:

$$\mathcal{P}_C = \{ C \otimes_R P \mid P \text{ is a projective } R\text{-module} \}$$

$$\mathcal{F}_C = \{ C \otimes_R F \mid F \text{ is a flat } R\text{-module} \}$$

$$\mathcal{I}_C = \{ \text{Hom}_R(C, I) \mid I \text{ is an injective } R\text{-module} \}.$$ 

**Remark 2.8.** The classes defined above are studied extensively in [7]. From [7], we know that
(i) The classes $\mathcal{F}_C$ and $\mathcal{P}_C$ are closed under arbitrary direct sums and summands, and, if $R$ is coherent, then $\mathcal{F}_C$ is also closed under arbitrary direct products.
(ii) The class $\mathcal{I}_C$ is closed under arbitrary direct products and summands.

**Definition 2.9.** [6]. An $R$-module $N$ is said to be $G_C$-injective ($G_C$-inj for short) if there exists an exact sequence

$$\cdots \to \text{Hom}_R(C, I^1) \to \text{Hom}_R(C, I^0) \to I_0 \to I_1 \to \cdots$$

in $R$-Mod with each $I_i$ and $I^i$ injective such that $N \cong \text{im}(\text{Hom}_R(C, I^0) \to I_0)$ and $\mathcal{Y}$ is $\text{Hom}_R(\mathcal{I}_C, -)$ exact. The exact sequence $\mathcal{Y}$ is called a complete $\mathcal{I}_C$-$I$-resolution of $N$.

An $R$-module $T$ is said to be $G_C$-flat if there exists an exact sequence

$$\cdots \to F_1 \to F_0 \to C \otimes_R F^0 \to C \otimes_R F^1 \to \cdots$$

in $R$-Mod with each $F_i$ and $F^i$ flat such that $M \cong \text{im}(F_0 \to C \otimes_R F^0)$ and $\mathcal{Z}$ is $\mathcal{I}_C \otimes_R -$ exact. The exact sequence $\mathcal{Z}$ is called a complete $\mathcal{F}\mathcal{F}_C$-resolution of $T$.

We will denote the classes of $G_C$-inj and $G_C$-flat modules by $\mathcal{G}\mathcal{I}_C$ and $\mathcal{G}\mathcal{F}_C$, respectively.

**Remark 2.10.** Similar to the proofs in [11] one can easily get that:

(i) Every $C$-injective $R$-module is $G_C$-inj, and the class $\mathcal{G}\mathcal{I}_C$ is coresolving and closed under arbitrary direct products and summands.
(ii) Every $C$-flat $R$-module is $G_C$-flat, and the class $\mathcal{G}\mathcal{F}_C$ is closed under arbitrary direct sums.
(iii) Every kernel of a complete $\mathcal{I}_C$-$I$-resolution (respectively, $\mathcal{F}\mathcal{F}_C$-resolution) belongs to $\mathcal{G}\mathcal{I}_C$ (respectively, $\mathcal{G}\mathcal{F}_C$).

By using the definition of $G_C$-flat modules and Remark 2.10, the proof of the next lemma is a standard argument.

**Lemma 2.11.** The following are equivalent for an $R$-module $M$:

(i) $M$ is $G_C$-flat.
(ii) $M$ satisfies the following two conditions:
(a) $\mathcal{I}_C \downarrow M$ and
(b) There exists an exact sequence $0 \to M \to C \otimes_R F^0 \to C \otimes_R F^1 \to \cdots$ in $R$-Mod with each $F^i$ flat such that $\mathcal{I}_C \otimes_R -$ leaves it exact.
(iii) There exists a short exact sequence $0 \to M \to C \otimes_R F \to G \to 0$ in $R$-Mod with $F$ flat and $G \in \mathcal{G}_F$.

Definition 2.12 ([7]). The Auslander class $\mathcal{A}_C$ with respect to $C$ consists of all $R$-modules $M$ satisfying:

(i) $\text{Tor}^R_{\geq 1}(C, M) = 0 = \text{Ext}^R_{\geq 1}(C, C \otimes_R M)$ and
(ii) The natural evaluation map $\mu_{CCM}: M \to \text{Hom}_R(C, C \otimes_R M)$ is an isomorphism.

Dually, the Bass class $\mathcal{B}_C$ with respect to $C$ consists of all $R$-modules $N$ satisfying
(a) $\text{Ext}^R_{\geq 1}(C, N) = 0 = \text{Tor}^R_{\geq 1}(C, \text{Hom}_R(C, N))$, and
(b) The natural evaluation map $\nu_{CCN}: C \otimes_R \text{Hom}_R(C, N) \to N$ is an isomorphism.

We now display some necessary results about the classes $\mathcal{A}_C$ and $\mathcal{B}_C$.

Lemma 2.13. ([7]). The following hold:

(i) If any two $R$-modules in a short exact sequence are in $\mathcal{A}_C$, respectively $\mathcal{B}_C$, then so is the third.
(ii) The class $\mathcal{A}_C$ contains all modules of finite flat dimension and those of finite $\mathcal{I}_C$-injective dimension. The class $\mathcal{B}_C$ contains all modules of finite injective dimension and those of finite $\mathcal{F}_C$-projective dimension.

To be a direct corollary of [7, Theorem 6.4], we have the following lemma:

Lemma 2.14. $\mathcal{P}_C \downarrow, \mathcal{B}_C, \mathcal{A}_C \downarrow \mathcal{I}_C$ and $\mathcal{A}_C \uparrow \mathcal{F}_C$.

3. $\mathcal{W}_F$-Gorenstein modules. We begin this section with the following notion of a $\mathcal{W}_F$-Gorenstein module.
Definition 3.1. An $R$-module $M$ is said to be $\mathcal{W}_F$-Gorenstein if there exists an exact sequence

$$\mathbb{W}_\bullet = \cdots \to W_1 \to W_0 \to W^0 \to W^1 \to \cdots$$

in $\mathcal{F}_C$ such that $M \cong \text{im}(W_0 \to W^0)$ and $\mathbb{W}_\bullet$ is $\text{Hom}_R(\mathcal{P}_C, -)$ and $\mathcal{I}_C \otimes_R$-exact.

It is clear that each module in $\mathcal{F}_C$ is $\mathcal{W}_F$-Gorenstein, and every kernel of $\mathbb{W}_\bullet$ is $\mathcal{W}_F$-Gorenstein.

In the following, we denote by $\mathcal{G}(\mathcal{W}_F)$ the class of $\mathcal{W}_F$-Gorenstein modules.

Proposition 3.2. $\mathcal{P}_C \perp \mathcal{G}(\mathcal{W}_F)$ and $\mathcal{I}_C \triangleright \mathcal{G}(\mathcal{W}_F)$.

Proof. It follows directly from Lemmas 2.4 and 2.14.

Proposition 3.3. Let $\mathbb{W}_\bullet = \cdots \to W_1 \to W_0 \to W^0 \to W^1 \to \cdots$ be an exact sequence in $\mathcal{F}_C$ and $M \cong \text{im}(W_0 \to W^0)$. Then $\mathbb{W}_\bullet$ is $\text{Hom}_R(\mathcal{P}_C, -)$ exact if and only if $M \in \mathcal{B}_C$.

Proof. Suppose $M \in \mathcal{B}_C$. By Lemma 2.13, every kernel of $\mathbb{W}_\bullet$ is in $\mathcal{B}_C$, and so $\mathbb{W}_\bullet$ is $\text{Hom}_R(\mathcal{P}_C, -)$ exact by Lemmas 2.4 and 2.14.

Conversely, if $\mathbb{W}_\bullet$ is $\text{Hom}_R(\mathcal{P}_C, -)$ exact, then by Lemmas 2.4 and 2.14, we have $\mathcal{P}_C \perp M$. Hence, there exists an exact sequence

$$\cdots \to W_1 \to W_0 \to I^0 \to I^1 \to \cdots$$

in $\text{R-Mod}$ with each $I^i$ injective such that $M \cong \text{im}(W_0 \to I^0)$ and $\text{Hom}_R(\mathcal{P}_C, -)$ leaves it exact. Thus, $M \in \mathcal{B}_C$ by [7, Theorem 6.1].

Now we are in a position to give the result linking the classes $\mathcal{G}\mathcal{F}_C$ and $\mathcal{G}(\mathcal{W}_F)$.

Theorem 3.4. Let $M$ be an $R$-module. Then $M \in \mathcal{G}(\mathcal{W}_F)$ if and only if $M \in \mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C$.

Proof. ($\Rightarrow$). Let $M \in \mathcal{G}(\mathcal{W}_F)$. We first have $\mathcal{I}_C \triangleright M$ by Proposition 3.2. Then $M \in \mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C$ by Lemma 2.11 and Proposition 3.3.
Let $M \in \mathcal{G}_C \cap \mathcal{B}_C$. Since $M \in \mathcal{G}_C$, we have that $\mathcal{I}_C \rightarrow M$, and there exists an exact sequence

$$0 \rightarrow M \rightarrow W^0 \rightarrow W^1 \rightarrow \cdots$$

in $R$-Mod with each $W^i \in \mathcal{F}_C$ such that $\mathcal{I}_C \otimes_R$-leaves it exact by Lemma 2.11. On the other hand, since $M \in \mathcal{B}_C$, it is easy to verify that $M$ has a proper left $\mathcal{P}_C$-resolution

$$\cdots \rightarrow V_1 \rightarrow V_0 \rightarrow M \rightarrow 0.$$ 

It follows from Lemmas 2.13 and 2.14 that $\mathcal{I}_C \otimes_R$-leaves it exact. Thus, we have the following exact sequence:

$$\cdots \rightarrow V_1 \rightarrow V_0 \rightarrow W^0 \rightarrow W^1 \rightarrow \cdots$$

such that $M \cong \text{im}(V_0 \rightarrow W^0)$. By Proposition 3.3, we know that $\text{Hom}_R(\mathcal{P}_C, -)$ leaves it exact. It follows that $M \in \mathcal{G}(\mathcal{W}_F)$. \hfill \Box

The following equivalence is comparable to [4, Theorem 3.11].

**Theorem 3.5.** There exists equivalence of categories:

$$\mathcal{G}(\mathcal{F}) \cap \mathcal{A}_C \xrightarrow{\text{C}_R \otimes -} \mathcal{G}(\mathcal{W}_F).$$

**Proof.** We first show that the functor $\text{Hom}_R(\mathcal{C}, -)$ maps $\mathcal{G}(\mathcal{W}_F)$ to $\mathcal{G}(\mathcal{F}) \cap \mathcal{A}_C$. Assume $M \in \mathcal{G}(\mathcal{W}_F)$. Then there exists an exact sequence:

$$\mathcal{W}_\bullet = \cdots \rightarrow W_1 \rightarrow W_0 \rightarrow W^0 \rightarrow W^1 \rightarrow \cdots$$

in $\mathcal{F}_C$ such that $M \cong \text{im}(W_0 \rightarrow W^0)$ and $\mathcal{W}_\bullet$ is $\text{Hom}_R(\mathcal{P}_C, -)$ and $\mathcal{I}_C \otimes_R$-exact. So $M \in \mathcal{B}_C$ by Theorem 3.4, and hence every kernel of $\mathcal{W}_\bullet$ is in $\mathcal{B}_C$ by Lemma 2.13. Thus, $\text{Hom}_R(\mathcal{C}, \mathcal{W}_\bullet)$ is exact; moreover, $\text{Hom}_R(\mathcal{C}, M) \in \mathcal{A}_C$ by [7, Proposition 4.1]. On the other hand, suppose that $W_1 \cong C \otimes_R F_1$ and $W^i \cong C \otimes_R F^i$, where each $F_i$ and $F^i$ flat. Then we have the following exact sequence in $R$-Mod:

$$\text{Hom}_R(\mathcal{C}, \mathcal{W}_\bullet) = \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow F^0 \rightarrow F^1 \rightarrow \cdots$$
such that $\text{Hom}_R(C, M) \cong \text{im}(F_0 \to F^0)$. For each injective $R$-module $I$, we have

$$I \otimes_R \text{Hom}_R(C, W_*) \cong C \otimes_R \text{Hom}_R(C, I) \otimes_R \text{Hom}_R(C, W_*)$$

$$\cong \text{Hom}_R(C, I) \otimes_R W_*$$

is exact. Hence, $\text{Hom}_R(C, M) \in G(F)$. The proof of $C \otimes_R$-maps $G(F) \cap A_C$ to $G(W_F)$ is similar. \qed

The next result on the properties of the class $G(W_F)$ will be used frequently in the sequel.

**Corollary 3.6.** Let $R$ be a GF-closed ring. Then the class $G(W_F)$ is closed under extensions, kernels of epimorphisms and direct summands.

**Proof.** We first show that the class $G(W_F)$ is closed under extensions when $R$ is GF-closed. Consider the following short exact sequence:

$$0 \to M \to N \to K \to 0$$

with $M$ and $K$ belonging to $G(W_F)$. Since $M \in B_C$ by Theorem 3.4, we get the next exact sequence:

$$0 \to \text{Hom}_R(C, M) \to \text{Hom}_R(C, N) \to \text{Hom}_R(C, K) \to 0.$$ 

It follows from Theorem 3.5 that $\text{Hom}_R(C, M)$ and $\text{Hom}_R(C, K)$ belong to $G(F) \cap A_C$. Thus, $\text{Hom}_R(C, N)$ belongs to $G(F) \cap A_C$. On the other hand, since $N \in B_C$ by Lemma 2.13 and Theorem 3.4, $N \cong C \otimes_R \text{Hom}_R(C, N) \in G(W_F)$ by Theorem 3.5.

The proofs of the class $G(W_F)$ is closed under kernels of epimorphisms and direct summands are similar to [1, Theorem 2.3 and Corollary 2.6]. \qed

The next lemma will be used in the proof of Theorem 3.8.

**Lemma 3.7.** Let $R$ be a GF-closed ring. For every short exact sequence $0 \to G_1 \to G_0 \to M \to 0$ in $R$-Mod with $G_0, G_1 \in G(W_F)$, if $\text{Tor}_1^R(\mathcal{I}_C, M) = 0$, then $M \in G(W_F)$. 

Proof. By the fact that the class \( \mathcal{F}_C \) is a closed direct summand and \([9, \text{Lemma } 4.1]\), the proof of the lemma is similar to \([1, \text{Theorem } 2.3]\). \(\square\)

One can compare the following theorem on \( \mathcal{G}(\mathcal{W}_F) \)-projective dimension to \([1, \text{Theorem } 2.8]\) and \([8, \text{Theorem } 2.6]\).

**Theorem 3.8.** Let \( R \) be a GF-closed ring and \( M \) a \( R \)-module with finite \( \mathcal{G}(\mathcal{W}_F) \)-projective dimension. Let \( n \) be a non-negative integer. Then the following are equivalent:

(i) \( \mathcal{G}(\mathcal{W}_F) \)-pd\(_R\)(\(M\)) \(\leq n\).
(ii) For every non-negative integer \( t \) such that \( 0 \leq t \leq n \), there exists an exact sequence \( 0 \rightarrow W_n \rightarrow \cdots \rightarrow W_1 \rightarrow W_0 \rightarrow M \rightarrow 0 \) in \( R\text{-Mod} \) such that \( W_i \in \mathcal{G}(\mathcal{W}_F) \) and \( W_i \in \mathcal{F}_C \) for \( i \neq t \).
(iii) There exists a short exact sequence \( 0 \rightarrow K \rightarrow G \rightarrow M \rightarrow 0 \) in \( R\text{-Mod} \) with \( G \in \mathcal{G}(\mathcal{W}_F) \) and \( \mathcal{F}_C\)-pd\(_R\)(\(K\)) \(\leq n-1\).
(iv) There exists a short exact sequence \( 0 \rightarrow M \rightarrow K' \rightarrow G' \rightarrow 0 \) in \( R\text{-Mod} \) with \( G' \in \mathcal{G}(\mathcal{W}_F) \) and \( \mathcal{F}_C\)-pd\(_R\)(\(K'\)) \(\leq n\).
(v) There exists an exact sequence \( 0 \rightarrow G \rightarrow V_{n-1} \rightarrow \cdots \rightarrow V_0 \rightarrow M \rightarrow 0 \) in \( R\text{-Mod} \) with \( G \in \mathcal{G}(\mathcal{W}_F) \) and \( V_i \in \mathcal{P}_C \) for all \( 0 \leq i \leq n-1 \).
(vi) For every exact sequence \( 0 \rightarrow K_n \rightarrow G_{n-1} \rightarrow \cdots \rightarrow G_0 \rightarrow M \rightarrow 0 \) in \( R\text{-Mod} \) with \( G_i \in \mathcal{G}(\mathcal{W}_F) \) for all \( 0 \leq i \leq n-1 \), then also \( K_n \in \mathcal{G}(\mathcal{W}_F) \).
(vii) \( \text{Tor}^{n+j}_R(U, M) = 0 \) for all \( j \geq 1 \) and all \( U \in \mathcal{I}_C \).
(viii) \( \text{Tor}^{n+j}_R(U, M) = 0 \) for all \( j \geq 1 \) and all \( U \) with \( \mathcal{I}_C\text{-rm id}_R(U) < \infty \).

Furthermore, we have

\[
\mathcal{G}(\mathcal{W}_F)\text{-pd}_R(M) = \sup\{n \in \mathbb{N} \mid \text{Tor}^n_R(U, M) \neq 0 \text{ for some } U \in \mathcal{I}_C\} = \sup\{n \in \mathbb{N} \mid \text{Tor}^n_R(U, M) \neq 0 \text{ for some } U \text{ with } \mathcal{I}_C\text{-id}_R(U) < \infty\}.
\]

Proof. (ii) \(\Rightarrow\) (iii) \(\Rightarrow\) (i) and (vi) \(\Rightarrow\) (i) are clear.

(i) \(\Rightarrow\) (vii) \(\Rightarrow\) (viii) follow from the usual dimension shifting argument.
(1) $\Rightarrow$ (ii). Since the class $\mathcal{G}(\mathcal{W}_F)$ is closed under extensions by Corollary 3.6, the proof is similar to [8, Theorem 2.6].

(iii) $\Rightarrow$ (iv). Since $G \in \mathcal{G}(\mathcal{W}_F)$, there exists a short exact sequence $0 \to G \to W \to G' \to 0$ in $R$-Mod with $W \in \mathcal{F}_C$ and $G' \in \mathcal{G}(\mathcal{W}_F)$. Now consider the following push-out diagram:

```
\begin{array}{ccc}
  0 & 0 & \\
  \downarrow & \downarrow & \\
  0 & K & G \\
  \downarrow & \downarrow & \downarrow \\
  0 & K & W \\
  \downarrow & \downarrow & \downarrow \\
  0 & K' & G' \\
  \downarrow & \downarrow & \downarrow \\
  0 & 0 & \\
\end{array}
```

From the second row in the above diagram, we know $\mathcal{F}_C\text{-pd}_R(K') \leq n$. So the third column is as desired.

(iv) $\Rightarrow$ (iii). Since $\mathcal{F}_C\text{-pd}_R(K') \leq n$, there exists a short exact sequence $0 \to K \to W \to K' \to 0$ in $R$-Mod with $W \in \mathcal{F}_C$ and $\mathcal{F}_C\text{-pd}_R(K) \leq n - 1$. Then consider the following pullback diagram:
From the second row, we know that $G \in \mathcal{G}(\mathcal{W}_F)$ by Corollary 3.6. So the first column is as desired.

(i) $\Rightarrow$ (v). It suffices to prove the case $n = 1$. Assume that $\mathcal{G}(\mathcal{W}_F)$-pd$_R(M) \leq 1$. Then there exists a short exact sequence $0 \to G_1 \to G_0 \to M \to 0$ in $R$-Mod with $G_0, G_1 \in \mathcal{G}(\mathcal{W}_F)$. By Theorem 3.4, we know that $G_0 \in \mathcal{B}_C$. Hence, it is easy to verify that there exists a short exact sequence $0 \to G'_0 \to V \to G_0 \to 0$ in $R$-Mod such that $V \in \mathcal{P}_C$, and also $V \in \mathcal{G}(\mathcal{W}_F)$. By Corollary 3.6, we have $G'_0 \in \mathcal{G}(\mathcal{W}_F)$. Now consider the following pullback diagram:
From the first column in the above diagram, we know that $G \in \mathcal{G}(\mathcal{W}_F)$ by Corollary 3.6. So the middle row is as desired.

(v) $\Rightarrow$ (vi). Let $0 \rightarrow K_n \rightarrow G_{n-1} \rightarrow \cdots \rightarrow G_0 \rightarrow M \rightarrow 0$ be an exact sequence in $R$-Mod with each $G_i \in \mathcal{G}(\mathcal{W}_F)$. Then also $G_i \in \mathcal{B}_C$ by Theorem 3.4. Hence, $K_n \in \mathcal{B}_C$ and $\mathcal{P}_C \perp K_n$ by Lemmas 2.13 and 2.14. Then we have the following commutative diagram with exact rows:

\[
\begin{array}{ccccccc}
0 & \rightarrow & G_n & \rightarrow & V_{n-1} & \rightarrow & \cdots & \rightarrow & V_1 & \rightarrow & V_0 & \rightarrow & M & \rightarrow & 0 \\
& & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & \\
0 & \rightarrow & K_n & \rightarrow & G_{n-1} & \rightarrow & \cdots & \rightarrow & G_1 & \rightarrow & G_0 & \rightarrow & M & \rightarrow & 0
\end{array}
\]

Thus, the mapping cone

\[
0 \rightarrow G_n \rightarrow V_{n-1} \oplus K_n \rightarrow \cdots \rightarrow V_0 \oplus G_1 \rightarrow G_0 \rightarrow 0
\]

is exact. It follows from Corollary 3.6 that $K_n \in \mathcal{G}(\mathcal{W}_F)$.

(viii) $\Rightarrow$ (i). By Lemma 3.7, the proof is similar to [1, Theorem 2.8].

The last claim is an immediate consequence of the equivalence of (i), (vii) and (viii).

Let $n$ be a non-negative integer. In what follows, we denote by $\mathcal{G}\text{-flat}_{\leq n}$ (respectively, $\mathcal{G}_C\text{-flat}_{\leq n}$) the class of modules with finite Gorenstein flat (respectively, $\mathcal{G}(\mathcal{W}_F)$-projective) dimension at most $n$.

**Theorem 3.9.** (Foxby equivalence). Let $\mathcal{F}$ be the class of flat modules. There are equivalences of categories:
Proof. Let $M$ be an $R$-module. It suffices to prove the equivalence of categories of the third row in the above diagram.

For the third row, it suffices to prove the case $n = 1$. Assume that $M \in \mathcal{G}_{C}\text{-flat}_{\leq 1}$. Then there exists a short exact sequence

$$0 \rightarrow G_{1} \rightarrow G_{0} \rightarrow M \rightarrow 0$$

in $R\text{-Mod}$ with $G_{0}, G_{1} \in \mathcal{G}(\mathcal{W}_{F})$. Since $G_{1} \in \mathcal{B}_{C}$ by Theorem 3.4, we have the following exact sequence in $R\text{-Mod}$:

$$0 \rightarrow \text{Hom}_{R}(C, G_{1}) \rightarrow \text{Hom}_{R}(C, G_{0}) \rightarrow \text{Hom}_{R}(C, M) \rightarrow 0$$

with $\text{Hom}_{R}(C, G_{0}), \text{Hom}_{R}(C, G_{1}) \in \mathcal{G}(\mathcal{F})\cap \mathcal{A}_{C}$ by Theorem 3.5. Hence, by Lemma 2.13, $\text{Hom}_{R}(C, M) \in \mathcal{G}\text{-flat}_{\leq 1} \cap \mathcal{A}_{C}$.

Conversely, assume that $M \in \mathcal{G}\text{-flat}_{\leq 1} \cap \mathcal{A}_{C}$. Then there exists a short exact sequence $0 \rightarrow G_{1} \rightarrow G_{0} \rightarrow M \rightarrow 0$ in $R\text{-Mod}$ with $G_{0}, G_{1} \in \mathcal{G}(\mathcal{F})\cap \mathcal{A}_{C}$. Since $M \in \mathcal{A}_{C}$ by Lemma 2.13, $\text{Tor}^{\geq 1}_{R}(C, M) = 0$. Thus, there exists a short exact sequence:

$$0 \rightarrow C \otimes_{R} G_{1} \rightarrow C \otimes_{R} G_{0} \rightarrow C \otimes_{R} M \rightarrow 0$$

in $R\text{-Mod}$. By Theorem 3.5, we know that $C \otimes_{R} G_{0}, C \otimes_{R} G_{1} \in \mathcal{G}(\mathcal{W}_{F})$. Hence, $C \otimes_{R} M \in \mathcal{G}_{C}\text{-flat}_{\leq 1}$. 

\qed
4. Stability of categories. We start with the following definition.

**Definition 4.1.** Let $M$ be an $R$-module and $n \geq 2$ an integer. We say that $M \in G^n(W_F)$ if there exists an exact sequence

$$
\mathcal{G}_\bullet = \cdots \longrightarrow G_1 \longrightarrow G_0 \longrightarrow G^0 \longrightarrow G^1 \longrightarrow \cdots
$$

in $G^{n-1}(W_F)$ such that $M \cong \text{im}(G_0 \rightarrow G^0)$ and $\mathcal{G}_\bullet$ is

$$
\text{Hom}_R(G^{n-1}(W_F), -)
$$

and

$$
G^{n-1}(W_F)^+ \otimes_R \text{-exact}.
$$

Set $G^0(W_F) = \mathcal{F}_C$, $G^1(W_F) = \mathcal{G}(W_F)$. One can easily check that there is a certain $G^n(W_F) \subseteq G^{n+1}(W_F)$ for all $n \geq 0$.

Similarly, one can also define modules which belong to $G^n(\mathcal{G}_C \cap \mathcal{B}_C)$ or $G^n(\mathcal{F})$ for $n \geq 2$.

The next two results are given in service of the proof of Lemma 4.4.

**Lemma 4.2.** $\mathcal{P}_C \perp G^2(W_F)$ and $\mathcal{I}_C \uparrow G^2(W_F)$.

*Proof.* It follows directly from Lemma 2.4, Proposition 3.2, and the fact that $\mathcal{P}_C \subseteq \mathcal{G}(W_F)$ and $\mathcal{I}_C \subseteq \mathcal{G}(W_F)^+$. \qed

**Lemma 4.3.** Let $R$ be a GF-closed ring. Then $\mathcal{P}_C$ is a projective generator for $\mathcal{G}(W_F)$.

*Proof.* Let $M$ be an $R$-module and $M \in \mathcal{G}(W_F)$. So $M \in \mathcal{B}_C$ by Theorem 3.4. Hence, we have a short exact sequence

$$
0 \longrightarrow M' \longrightarrow C \otimes_R P \longrightarrow M \longrightarrow 0
$$

in $R$-$\text{Mod}$ with $P$ projective. By Corollary 3.6, we know that $M' \in \mathcal{G}(W_F)$.

On the other hand, it follows from Proposition 3.2 that $\mathcal{P}_C \perp \mathcal{G}(W_F)$. Thus, $\mathcal{P}_C$ is a projective generator for $\mathcal{G}(W_F)$. \qed
Lemma 4.4. Let $R$ be a GF-closed ring, and let $M$ be an $R$-module which belongs to $G^2(W_F)$. Then $M$ admits a proper left $P_C$-resolution.

Proof. It follows directly from the definition of modules which belong to $G^2(W_F)$, Lemma 4.2, Lemma 4.3 and [10, Lemma 2.2 (b)].

Now we can give another main result in the paper.

Theorem 4.5. Let $R$ be a GF-closed ring. Then we have $G^n(W_F) = G(W_F)$ for all $n \geq 1$.

Proof. It suffices to prove the case $n = 2$. Let $M$ be an $R$-module and $M \in G^2(W_F)$. Following from Lemma 4.4, we have the exact sequence

$$(\alpha) = \cdots \rightarrow C \otimes_R P_1 \rightarrow C \otimes_R P_0 \rightarrow M \rightarrow 0$$

in $R$-Mod with each $P_i$ projective such that $\text{Hom}_R(P_C, -)$ leaves it exact. By Lemma 2.4, Lemma 2.14 and Lemma 4.2, we know that $I_C \otimes_R -$ leaves $(\alpha)$ exact as well.

On the other hand, since $M \in G^2(W_F)$, there exists a short exact sequence $0 \rightarrow M \rightarrow G \rightarrow M' \rightarrow 0$ in $R$-Mod with $G \in G(W_F)$ and $M' \in G^2(W_F)$. Since $G \in G(W_F)$, there exists a short exact sequence $0 \rightarrow G \rightarrow C \otimes_R F^0 \rightarrow G' \rightarrow 0$ in $R$-Mod with $F^0$ flat and $G' \in G(W_F)$. Then we have the push-out diagram
Consider the following short exact sequence coming from the middle row of the above diagram:

\[(\beta) = 0 \rightarrow M \rightarrow C \otimes_R F^0 \rightarrow K \rightarrow 0.\]

From the third column of the above push-out diagram, we know that \(I_C \perp K\) by Proposition 3.2 and Lemma 4.2. Hence, \((\beta)\) is \(\text{Hom}_R(P_C, -)\) and \(I_C \otimes_R -\) exact. If we can construct a short exact sequence \((\eta) = 0 \rightarrow K \rightarrow C \otimes_R F^1 \rightarrow K' \rightarrow 0\) in \(R\)-Mod with \(F^1\) flat and \(K'\) a module with the same property as \(K\) (that is, there exists a short exact sequence \((\mu) = 0 \rightarrow M'' \rightarrow K' \rightarrow H'' \rightarrow 0\) in \(R\)-Mod with \(M'' \in \mathcal{G}^2(W_F)\) and \(H'' \in \mathcal{G}(W_F)\)), then the following exact sequence can be constructed recursively:

\[(\gamma) = 0 \rightarrow K \rightarrow C \otimes_R F^1 \rightarrow C \otimes_R F^2 \rightarrow \cdots \rightarrow K' \rightarrow 0\]

From the middle row of the above push-out diagram and \((\mu)\), we get \(P_C \perp K\) and \(I_C \perp K'\) by Proposition 3.2, Lemma 2.14 and Lemma 4.2. Then we have that \((\eta)\) is \(\text{Hom}_R(P_C, -)\) and \(I_C \otimes_R -\) exact. So is
Assembling the sequence \((\alpha), (\beta)\) and \((\gamma)\), we get the next exact sequence in \(R\text{-Mod}\)

\[
\cdots \rightarrow C \otimes_R P_1 \rightarrow C \otimes_R P_0 \rightarrow C \otimes_R F^0 \rightarrow C \otimes_R F^1 \rightarrow \cdots
\]

such that \(M \cong \text{im}(C \otimes_R P_0 \rightarrow C \otimes_R F^0)\), and \(\text{Hom}_R(P_C, -)\) and \(\mathcal{I}_C \otimes_R -\) leave it exact. It follows that \(M \in \mathcal{G}(\mathcal{W}_F)\).

Indeed, since \(M' \in \mathcal{G}^2(\mathcal{W}_F)\), there exists a short exact sequence \(0 \rightarrow M' \rightarrow H \rightarrow M'' \rightarrow 0\) in \(R\text{-Mod}\) with \(H \in \mathcal{G}(\mathcal{W}_F)\) and \(M'' \in \mathcal{G}^2(\mathcal{W}_F)\). Now consider the following push-out diagram:

\[
\begin{array}{ccccccc}
0 & 0 \\
\downarrow & \downarrow \\
0 & M' & K & G' & 0 \\
\downarrow & \downarrow & \downarrow & \downarrow & \downarrow \\
0 & H & H' & G' & 0 \\
\downarrow & \downarrow & \downarrow & \downarrow & \downarrow \\
M'' & M'' \\
0 & 0
\end{array}
\]

From the middle row of the above diagram, we know \(H' \in \mathcal{G}(\mathcal{W}_F)\) by Corollary 3.6. Then there exists a short exact sequence \(0 \rightarrow H' \rightarrow C \otimes_R F \rightarrow H'' \rightarrow 0\) in \(R\text{-Mod}\) with \(F\) flat and \(H'' \in \mathcal{G}(\mathcal{W}_F)\). Consider another push-out diagram.
It is trivial that the third column in the above diagram is as desired. This completes the proof.

The following corollary is an immediate consequence of Theorem 3.4 and Theorem 4.5.

**Corollary 4.6.** Let $R$ be a GF-closed ring. Then we have $\mathcal{G}_n(\mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C) = \mathcal{G}\mathcal{F}_C \cap \mathcal{B}_C$ for all $n \geq 1$.

When we set $C = R$ in Corollary 4.6, we obtain the next result on the class of Gorenstein flat modules appeared in [12, Theorem 4.3] and [2, 1.2].

**Corollary 4.7.** Let $R$ be a GF-closed ring. Then we have $\mathcal{G}_n(\mathcal{F}) = \mathcal{G}(\mathcal{F})$ for all $n \geq 1$.
